

# MEDIATIVE URBANISM

## Adaphne Loops - Mediative Urbanism

The masterplan for the 30-acre post-industrial site in Louisville considers the sub central area as an economic and urban core for the wider surrounding territory of the Irish Hill neighbourhood region. An exemplar model for how we might approach new urban developments in post industrial regions that have an underlying structure.

Weaving the urban threads and its three pronged approach to urban **sustainability** has a key ambition of **ongoing renewal** and adaptability as a key ambition of ongoing renewal and **adaptability** to its urban structure. The **multi-scalar economic, social and environmental** considerations attempt to consider the city from a range of crucial but overlapping perspectives. Where the Louisville site threads a **complex eco system** where nature and man collide.

This complex urban eco system proposes an economic sustainable approach; a 'triple bottom line' where corporate and societal interests intersect, turning social responsibility into financial opportunity at the same time. Large corporate models and emerging micro economies support each other in post productive processes and variations in supply and demand

The urban city model seeks to develop a living structure which supports and accommodates change in the cities economic, environmental and social systems. This urban model is constructed as a set of clusters which allows for incremental growth and change to its structure without massive implications to the city and it's people.
